(PDF) Digital signal processing: Adaptive signal processing
Adaptive Signal Processing is concerned with the design, analysis, and implementation of systems whose structure changes in response to the incoming data. Application areas are similar to those of optimal signal processing but now the environment is changing, the signals are nonstationary and/or

the parameters to be estimated are time-varying.

Bernard Widrow's Profile | Stanford Profiles

Adaptive filters are digital filters whose coefficients change with an objective to make the filter converge to an optimal state. The optimization criterion is a cost function, which is most commonly the mean square of the error signal between the output of the adaptive filter and the desired signal.
