Closed Loop Hybrid Tesla Turbine

There is plenty of interest in using Tesla turbines with organic rankine cycle systems, to enable power generation with waste heat or solar power. A number of major changes have been made to make this turbine useable in a closed-loop system (working fluid is constantly reheated and cooled). In the other words no air, gas, steam, water can escape.

The turbine of the present invention is particularly useful as a wind turbine or the like, and provides maximum efficiency in converting wind energy to mechanical power. It can also be used in geothermal applications, in which a refrigerant fluid, flowing in a closed loop, is used to drive the turbine."

Turbine engines, especially Tesla turbines, are ideal for hybrid systems because they create good power for their size and run most efficiently at consistant high RPMs. Nikola Tesla first thought of using one of his boundary disc turbines (see link), along with an AC generator and motor, in a car nearly 100 years ago.

Halfbakery: Tesla Turbine Hybrid

The Tesla turbine is a bladeless centripetal flow turbine patented by Nikola Tesla in 1913. It is referred to as a bladeless turbine. The Tesla turbine is also known as the boundary-layer turbine, cohesion-type turbine, and Prandtl-layer turbine because it uses the boundary-layer effect and not a fluid impinging upon the blades as in a conventional turbine. Bioengineering researchers have referred to it as a multiple-disk centrifugal pump. One of Tesla's desires for implementation of this turbin

The Tesla turbine, using a low boiling medium in a closed loop, generates power from waste heat at about 120°C. An organic Rankine or Kalina cycle can be used for efficient recovery.
