TiN Hard Mask (TiN-HM) integration scheme has been widely used for BEOL patterning in order to avoid ultra low-k (ULK) damage during plasma-ash process [1]. As the technology node advances, new integration schemes have to be used for the patterning of features below 80 nm pitch with 193 nm immersion lithography. In particular, thicker TiN-HM is necessary in order to ensure Self-Aligned-Via ...

The method involves combining a polymer solution (e.g., PLGA dissolved in methylene chloride) and ultrapure distilled water, forming two immiscible layers. The immiscible phases are then homogenized to form an emulsion where water acts as the dispersed phase and the polymer solution acts as the continuous phase.

Dry plate, in photography, glass plate coated with a gelatin emulsion of silver bromide. It can be stored until exposure, and after exposure it can be brought back to a darkroom for development at leisure. These qualities were great advantages over the wet collodion process, in which the plate had to be prepared just before exposure and developed immediately after.
